

Postdoctoral Position/Tumor-targeted liposomes
Department of Medical Biophysics
University of Toronto

Our laboratory is devising new targeted agents for cancer therapy based on the use of in-house aptamer ligands (see Ferreira (2009) *Nucleic Acids Res.* 37, 866–876 as an example; www.jeangariepy.com). A postdoctoral position is available for a recent Ph.D. graduate (2009-present) trained in the preparation and characterization of PEGylated liposomes. Familiarity with cell culture techniques and animal work would represent important additional assets. The position is for a minimum time period of 2 years and is aimed at applicants that can join our group within the next 6 months. To be considered for the position, please send by email to Dr. Jean Gariépy [gariepy@sri.utoronto.ca] a copy of your curriculum vitae including the name and email address of two individuals acting as your referees. The deadline for applying for this position is April 15, 2010.
